Rear View Mirror Adhesive

Technical Data Sheet

Rev 12/07

PRODUCT DESCRIPTION: A two-part adhesive that permanently bonds metal mirror buttons to windshields.

WORKS BEST ON: Metal rear view mirror buttons. **Not recommended for plastic mirror buttons.**

PRODUCT FEATURES:

Tensile Strength: 2,500 psi
Color: Clear
Water Resistant
Working Time: 1-60 Seconds
Set/Cure Time: 30 Minutes
Temperature Range: -60ºF to 200ºF
Chemical Solvent Resistance: **The Rear View Mirror Adhesive is not recommended for long term exposure to chemicals and solvents.**
Storage: Store in a cool, dry environment.

SURFACE PREPARATION: Read all directions prior to starting repair. Do not apply in a hot environment. Remove the mounting button from the mirror bracket. On the outside of the windshield mark the spot where the button was with a crayon or (removable) marker.

REMOVAL METHODS: The easiest solution would be to purchase a new bracket from your local auto parts store and install it (the correct way) over top the existing one.

Trying to remove the existing one could be time consuming and we do not recommend this. You could soak a cotton ball in acetone and hold it on the bracket until the bond is loosened; however you may need to do this several hours (re-soaking the cotton ball periodically) do not force the bracket off the windshield; **as any attempt in trying to remove the bracket could damage your windshield.** The bracket should come off easily, if not you will need to keep soaking the acetone soaked cotton ball on it until it can be removed without force.

HELPFUL HINTS: Regarding our Rear View Mirror Adhesive, when mounting the bracket onto the glass and holding with pressure, the slightest movement at this time could cause a weak bond. Even the tiniest dust particle or the oils from a fingerprint on the area could cause the adhesive not to bond properly. After the adhesive is set allow 30 minutes before mounting the mirror to bracket.

See MSDS for more complete information, safe handling instructions and first aid.
